**SUBJECT:** Lithium Reanalysis – HW01 18 July 2012  
Dimock, PA

**FROM:** Dawn A. Ioven, toxicologist  
Technical Support Branch (3HS41)

**TO:** Rich Fetzer, OSC  
Eastern Response Branch (3HS31)

Samples initially collected from residential wells in Dimock during Weeks 1 through 4 were recently reanalyzed to achieve lower detection limits for lithium. Findings for HW01 are presented below.

**Lithium**

Lithium was reported in HW01 at concentrations of 40.7 and 41 ug/L, respectively, in unfiltered and filtered samples collected from the wellhead. These concentrations slightly exceed lithium's risk-based screening level of 31 ug/L; long-term exposure to the maximum wellhead concentration of lithium (41 ug/L) would generate a Hazard Quotient of 1.3. Under acute exposure conditions, ATSDR has suggested a screening concentration of 1500 ug/L for lithium in drinking water.
